Metal ring with paper stars

Instructions No. 2574

Difficulty: Beginner

Working time: 4 Hours

This impressive light decoration is the perfect highlight for the winter and Christmas season. Through the light chain, the stars folded from transparent paper shine beautifully and conjure up a great light. Learn how to recreate the metal ring with paper stars in these instructions.

Impressive light decoration with stars

Tie the two metal rings together with copper wire and then attach the LED light chain to the rings.

You can fix the battery compartment to the metal ring with a little hot glue.

Fold the stars out of the transparent paper. This works as follows:

The folding paper is folded into a triangle from both sides and unfolded again. The fold runs diagonally from one corner to the other.

Now fold the straight sides onto each other. Unfold the sheet again.

Cut the straight creases about halfway so that there are four cuts. Fold the straight sides to the diagonal creases.

Now glue the tips of the triangles on top of each other

with craft glue. This creates a 3D look.

You need two halves per star.

Tip: To make smaller stars, simply cut the square of the folded sheets smaller.

Glue one half of the star onto the metal rings with hot glue and leave to dry.
Turn the rings over and glue the other half to the metal ring from behind.

Finally, attach a ribbon to the metal ring for hanging.
